IT-19661.

question: Finding Prime up to a range given in a file namely input.csv and write the number of Prime numbers to output.csv file.

Answer:

Problem statement

Given a file named input.csv containing a ranges of integers, write a Program to:

1. Read the range from input.csv.
2. Find all Prime numbers within that range.
3. write the total number of Prime numbers to a file named output.csv.

Algorithm

1. Read Input:

→ Read the starting and ending numbers

from input.csv ;

step 2 : check for Prime

For each number n in the range :

→ if $n \leq 1$, it is not Prime .

→ check divisibility from 2 to $\sqrt{n}$.

→ if no divisor is found, the number is Prime .

Step 3 : Count Primes

→ count how many Prime number exist in the given range .

step 4 : write output

→ write the total count to output.csv

Flowchart logic

→ start

→ Read value from input.csv

JT-29661

3. For each number in the range.

4. check if Prime.

5. if Prime → increment count.

6. write count to output.csv

7. End.
